

# Simoa<sup>®</sup> RAGE Developer Kit Data Sheet Item 100-0171

## Description – Receptor for Advanced Glycation Endproducts (RAGE)

RAGE is a 35 kDa transmembrane receptor of the immunoglobulin super family. RAGE consists of 5 domains: the cytosolic domain, the variable domain, two constant domains, and the transmembrane domain. RAGE binds to advanced glycation end products such as glycoproteins to activate pro-inflammatory genes.

Calibration Curve: Calibrator concentrations and Lower Limit of Quantification are depicted in the figure below. This standard curve is for demonstration purposes; end users should prepare a standard curve for each assay run.

### Minimum Required Dilution (MRD)

| Diluted Sample volume             | 50 μL           |
|-----------------------------------|-----------------|
| (1:10 Dilution)*                  | per measurement |
| *See Kit Instructions for details |                 |

Assay Range: The upper end of the dynamic range is equal to the top calibrator concentration multiplied by MRD.

| Analytical<br>LLOQ         | 1.46 pg/mL       |
|----------------------------|------------------|
| Functional<br>LLOQ (x MRD) | 14.6 pg/mL       |
| LOD                        | 0.302 pg/mL      |
| Assay Range                | 0 – 15,000 pg/mL |

Endogenous Serum and Plasma Readings: Healthy EDTA plasma (n=4) and serum (n=4) samples were measured.

| % Above LOD  | 100% |
|--------------|------|
| % Above LLOQ | 100% |

Note: Data described were developed during assay development. Under different assay conditions, assay may perform differently than shown. For complex matrices such as serum or plasma, assay diluent optimization (for example by adding blocking agents) may improve performance of these matrices in this assay.
